

DemurrageOS Team Collaboration Guide

Welcome to the DemurrageOS project! This guide will walk you through the steps to get the code on your machine, make your changes, and safely merge them into the main project.

Step 1: Accept the GitHub Invitation

Our project is hosted at <https://github.com/Aryapd021/DemurrageOS>.

1. Check your email or GitHub notifications for an invitation to collaborate.
2. Accept the invitation to get push/pull access to the repository.

Step 2: Clone the Repository

Once you have access, download the code to your local machine. Open your terminal or VS Code and run:

```
git clone https://github.com/Aryapd021/DemurrageOS.git
cd DemurrageOS
```

Step 3: Create Your Feature Branch

Rule of thumb: Never work directly on the main branch. Always create a new branch for your specific task (Frontend, AI, Database, etc.).

Run this command to create and switch to your new branch:

```
# Replace 'feature/your-part' with your actual task
git checkout -b feature/your-part
```

Examples:

- Frontend: `git checkout -b feature/frontend-setup`
- AI: `git checkout -b feature/ai-models`
- Database: `git checkout -b feature/database-schema`

Step 4: Make Changes and Commit

Work on your files within your designated folder (e.g., `/frontend`, `/ai`, `/database`). Once you reach a good stopping point, save your work to Git:

```
# Stage all your changes
```

```
git add .
```

```
# Commit with a clear, descriptive message  
git commit -m "Added initial React setup for frontend"
```

Step 5: Push Your Branch to GitHub

Upload your branch and its commits to the GitHub repository:

```
# Replace 'feature/your-part' with your branch name  
git push -u origin feature/your-part
```

Step 6: Open a Pull Request (PR)

1. Go to the [DemurrageOS GitHub Page](#).
2. You will see a green button that says **Compare & pull request** next to your recently pushed branch. Click it.
3. Add a brief description of what you built.
4. Click **Create pull request**.
5. The team will review your code and merge it into the main branch!

Quick Tips & Best Practices

- **Keep your local code updated:** Before starting work for the day, always pull the latest changes from the main branch:

```
git checkout main  
git pull origin main  
git checkout feature/your-part
```
- **Folder Structure:** Please keep your code in the appropriate directory (/frontend, /backend, /ai, etc.) to prevent messy conflicts.
- **Communicate:** If you are unsure about a merge conflict, ask the team before forcing any changes!
